15

30

35

1. A method of producing a composite sheet, comprising: a step of preparing a first ceramic sheet from a ceramic powder, and a different kind of sheet made of a material different from that of the first ceramic sheet, both of said sheets having substantially the same thickness;

a step of forming a through hole in a predetermined portion of said first ceramic sheet;

a step of laminating said different kind of sheet on said first ceramic sheet in which said through hole is formed; and a step of preparing a composite sheet by pressing the portion of said first ceramic sheet where the through hole is formed from the side of said different kind of sheet, such that a portion of said different kind of sheet is buried in the through hole in a manner that said first ceramic sheet and said different kind of sheet are integrated together.

- 2. A method of producing a composite sheet according to claim 1, wherein said different kind of sheet is a burn-and-extinguish sheet made of a material that extinguishes by burning through the heat treatment.
- A method of producing a composite sheet according to claim
   2, wherein said burn-and-extinguish sheet contains resin beads having an average particle size of 1 to 20 μm.
  - 4. A method of producing a composite sheet according to claim 2, wherein said burn-and-extinguish sheet is a carbon sheet made from a carbon powder.
    - 5. A method of producing a composite sheet according to claim 1, wherein said different kind of sheet is a metal sheet made from a metal powder.
    - 6. A method of producing a composite sheet according to claim

5, wherein the metal powder in said metal sheet contains a low-melting metal powder in an amount of 10 to 60% by volume and a high-melting metal powder in an amount of 40 to 90% by volume.

5

7. A method of producing a composite sheet according to claim 1, wherein said different kind of sheet is a second ceramic sheet formed from a ceramic powder different from that of the first ceramic sheet.

10

30

- 8. A method of producing a composite sheet according to claim 7, wherein a conductor is printed on the surface of said second ceramic sheet.
- 9. A method of producing a composite sheet according to claim 1, wherein a conductor is printed on the surface of said first ceramic sheet.
- 10. A method of producing a composite sheet according to claim
  20 1, wherein said first ceramic sheet is made of a ceramic material
  that can be fired at a temperature in excess of 1100°C.
- 11. A method of producing a composite sheet according to claim 1, wherein said first ceramic sheet is made of a ceramic material that can be fired at a low temperature of not higher than 1050°C.
  - 12. A method of producing a composite sheet according to claim
    1, further comprising a step of swelling at least one of the
    first ceramic sheet or the different kind of sheet at a boundary
    portion thereof, and a step of pressing the composite sheet that
    has been swellen in the direction of thickness.
- 13. A method of producing a composite sheet according to claim
  1, further comprising a step of applying a paste onto the
  35 boundary portion between the first ceramic sheet and the
  different kind of sheet to form a coating layer on said portion.

14. A method of producing a composite sheet comprising:
 a step of preparing a first ceramic sheet and a different
kind of sheet made of a material different from the first ceramic
sheet, both of the sheets having substantially the same
thickness;

a step of laminating said first ceramic sheet and said different kind of sheet one upon the other; and

5

10

a step of preparing a composite sheet by pressing a predetermined portion of the laminate from the side of said different kind of sheet, such that the pressed portion of said different kind of sheet is transferred onto the side of said first ceramic sheet to integrate said first ceramic sheet and said different kind of sheet together.

- 15. A method of producing a composite sheet according to claim 14, wherein said different kind of sheet is a burn-and-extinguish sheet made of a material that extinguishes by burning through the heat treatment.
- 20 16. A method of producing a composite sheet according to claim 15, wherein said burn-and-extinguish sheet contains resin beads having an average particle size of 1 to 20 μm.
- 17. A method of producing a composite sheet according to claim
  25 15, wherein said burn-and-extinguish sheet is a carbon sheet
  made from a carbon powder.
- 18. A method of producing a composite sheet according to claim 14, wherein said different kind of sheet is a metal sheet made 30 from a metal powder.
- 19. A method of producing a composite sheet according to claim 18, wherein the metal powder in said metal sheet contains a low-melting metal powder in an amount of 10 to 60% by volume 35 and a high-melting metal powder in an amount of 40 to 90% by volume.

20. A method of producing a composite sheet according to claim 14, wherein said different kind of sheet is a second ceramic sheet formed from a ceramic powder different from that of the first ceramic sheet.

5

- 21. A method of producing a composite sheet according to claim 20, wherein a conductor is printed on the surface of said second ceramic sheet.
- 10 22. A method of producing a composite sheet according to claim 14, wherein a conductor is printed on the surface of said first ceramic sheet.
- 23. A method of producing a composite sheet according to claim
  15 14, wherein said first ceramic sheet is made of a ceramic material that can be fired at a temperature in excess of 1100°C.
- 24. A method of producing a composite sheet according to claim 14, wherein said first ceramic sheet is made of a ceramic 20 material that can be fired at a low temperature of not higher than 1050°C.
- 25. A method of producing a composite sheet according to claim 14, further comprising a step of swelling at least one of the 25 first ceramic sheet or the different kind of sheet at a boundary portion thereof, and a step of pressing the composite sheet that has been swellen in the direction of thickness.
- 26. A method of producing a composite sheet according to claim 30 14, further comprising a step of applying a paste onto the boundary portion between the first ceramic sheet and the different kind of sheet to form a coating layer on said portion.
- 27. A method of producing a laminate by using a composite sheet, 35 comprising a step of producing a laminate by laminating a first ceramic sheet or other composite sheet on the composite sheet

produced by the method according to any one of claims 1 to 26.

- 28. A method of producing a laminate according to claim 27, wherein said different kind of sheet is a burn-and-extinguish sheet made of a material that extinguishes by burning through the heat treatment, and a cavity is formed by burning and extinguishing the burn-and-extinguish sheet through firing.
- 29. A method of producing a laminate according to claim 27, 10 further comprising a step of firing said laminate.
  - 30. A method of producing a laminate according to claim 27, wherein said laminate forms a multi-layer circuit board.
